Use Figma to simulate a handoff scenario in a mobile network and visualize the process.

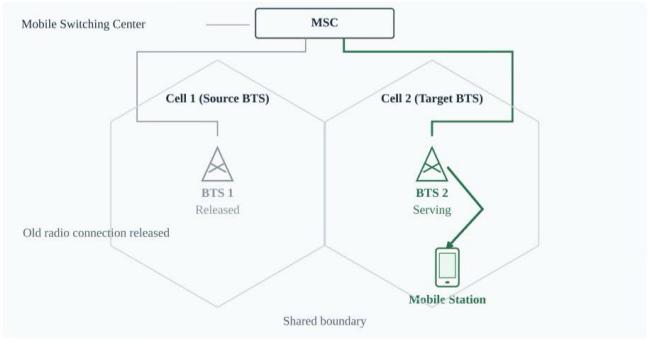

Handoff Process in a Mobile Cellular Network

STATIC TEACHING SEQUENCE

Conceptual cellular handoff · The session is maintained while the serving BTS changes.

03 / 03 **After Handoff**

Serving cell: Cell 2 · Source radio connection: released

5 **Handoff Completion**

Communication continues with minimal interruption.

BTS 2 now serves the Mobile Station inside Cell 2. The network maintains the same ongoing session.

Transfer confirmed

Serving radio link	**BTS 2 ↔ Mobile Station**
Old BTS 1 connection	Released; no active radio link
Session	Maintained through MSC

One session, a new serving cell

1 Movement → 2 Measurement → 3 Decision
→ 4 Transfer → 5 Completion

Reset Simulation

Return to Before Handoff → restore the source serving link.
Visual control only · No interactive wiring

Legend Source serving · Handoff / preparation · Target serving · Signal measurement · Solid: active link / sequence flow

Network paths are schematic: BTS–MSC links include omitted access controllers. Resource preparation is not an active target radio connection.

Session continuity is the objective; brief interruption depends on the radio system.

Conceptual model · Not to scale
